

client.py - One Page Workflow Summary

The client file runs on each Jetson. It connects the Jetson to the experiment server, asks local Ollama/Gemma what to say on each turn, prints the raw model output, lightly parses chat vs answer, and sends the result back.

Staged client.py workflow

Stage	Name	What happens
1	Startup check	Checks that Ollama is running and that gemma3:4b is available. If not, the client stops.
2	Warmup	Sends a tiny prompt, "Say ready.", so Ollama loads the model before the real trial. keep_alive=300 keeps it loaded for about 5 minutes after use.
3	Connect	Connects to the server at SERVER_IP:SERVER_PORT and sends the Jetson hostname when requested.
4	Trial start	Receives assigned agent name, private figures, number of agents, pool size, and figures per card.
5	Turn	When the server sends your_turn, the client builds a prompt from current state + recent visible messages and sends it to Ollama.
6	Response	Prints [MODEL RAW], parses ACTION: CHAT or ACTION: ANSWER, then sends chat text or final word back to the server.
7	Reconnect	If the server disconnects, the client waits 5 seconds and tries to connect again.

What Ollama receives before each response

Ollama does not see the hidden common figure. It receives the agent rules, this agent's private figures, current round, whether final answer is allowed, whether this agent already shared its figures, this agent's previous message, and the last 5 visible public messages.

Example of what Ollama may see:

```
CURRENT STATE:
- You are: Agent2
- Total agents: 3
- Current round: 2
- Final answer allowed now: no
- Your figures: circle, cross, square
- You already shared your figures: yes
- Your previous message: My figures are circle, cross, square.

RECENT PUBLIC MESSAGES:
[SYSTEM]: ===== ROUND 2 =====
[SYSTEM]: [Waiting for Agent1 to respond]
[Agent1]: My figures are circle, triangle, cross.
[Agent3]: My figures are square, cross, asterisk.

YOUR TURN:
This is the discussion stage. You are not allowed to submit a final answer yet.
Use only:
ACTION: CHAT
MESSAGE: <your message>
```

Important note: the server may know and print the true common figure for you, but Ollama does not receive that hidden answer unless it appears in public messages.
